## INTRODUCTION

This leaflet brings together key data relating to science, technology, engineering and mathematics (STEM) education. It focuses on the number of people studying STEM subjects at GCSE,A-Level and undergraduate degree levels and also includes data on apprenticeships. We hope it will be of use to policymakers, members of the STEM education community, employer groups and others involved in discussing policy interventions in this area.

When drawing together data that spans many years, some issues of consistency can arise. Retrospective adjustments can be made to GCSE and A-Level datasets post-publication for example, or undergraduate subjects may be reclassified into different subject groupings. Notwithstanding such issues, we have satisfied ourselves that the data included here fairly represent the major trends in STEM education. We have also identified the source for each dataset used.

## GCSEs

The overall GCSE cohort size has been declining for several years. In 2007 there were approximately 800,000 16 year olds, falling to around 690,000 by 2014 .
From 2008 in England and Wales, and 2010 in Northern Ireland, Core Science and Additional Science replaced Single Science and Double Science (which counted as two GCSEs).

There have been a number of changes in the last decade to the accountability measures and assessment rules that influence the entry patterns of schools in science. These include: the removal of the requirement for academies to follow the National Curriculum; changes in the way that applied/vocational qualifications such as BTECs are counted in school league tables; introduction of the EBacc measure; and changes to rules around coursework, terminal assessment and the resitting of modules.

The most striking trend in the last decade has been the rise of separate GCSEs in biology, chemistry and physics (referred to as 'Triple Science' when all three are sat together). Entries to Triple Science increased threefold in the decade to 2013. This rise can be traced to government policy announced in 2006, which required all state schools to make Triple Science available to their students.

When looking at GCSEs alongside A-Level trends (see next section), a correlation can be observed between the increase in the number of students studyingTriple Science at GCSE and an increase in the number of science A-Levels achieved two years later.

|  | Triple Science |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ๗ٍ | $\begin{aligned} & \overrightarrow{00} \\ & \frac{0}{0} \\ & \frac{0}{0} \end{aligned}$ | $\begin{aligned} & \vec{~} \\ & \stackrel{H}{\epsilon} \\ & \stackrel{\text { U }}{U} \end{aligned}$ |  |  |  | o |  |
| 2005 | 56,522 | 53,428 | 52,568 | 494,450 | 89,348 |  |  |
| 2006 | 60,082 | 56,764 | 56,035 | 479,789 | 96,374 |  |  |
| 2007 | 63,208 | 59,216 | 58,391 | 478,028 | 98,485 | 57,316 |  |
| 2008 | 85,521 | 76,656 | 75,383 | 8,433 | 4,445 | 537,606 | 433,468 |
| 2009 | 100,905 | 92,246 | 91,179 | 7,594 | 3,954 | 493,505 | 396,946 |
| 2010 | 129,464 | 121,988 | 120,455 | 7,497 | 4,060 | 449,697 | 352,469 |
| 2011 | 147,904 | 141,724 | 140,183 |  |  | 405,977 | 306,312 |
| 2012 | 166,168 | 159,126 | 157,377 |  |  | 552,504 | 289,950 |
| 2013 | 174,428 | 166,091 | 160,735 |  |  | 451,433 | 283,391 |
| 2014 | 141,900 | 138,238 | 137,227 |  |  | 374,961 | 323,944 |

Table I: Entries to science GCSEs in the UK (all ages). Source:JCQ

The correlation is particularly striking in the case of physics, where A-Level numbers began to rise steeply from 2008 after falling for nearly two decades. However, examining the data for chemistry and biology suggests that, although a contributing factor, it was not Triple Science alone that led to the rise in A-Level science numbers. Chemistry and biology A-Level numbers began to rise before Triple Science was introduced in many schools, although one can observe a steepening in the rate of rise when Triple Science began to become widespread.

2014 saw a significant fall in the numbers takingTriple Science at GCSE.This has most likely been the result of a combination of factors, including a large reduction in the number of students entering GCSE a year early, and possibly teacher concerns about the assessment load of Triple Science especially on borderline grade C students - now that the majority of assessment is terminal rather than modular. We will need to wait until 2015 to see the degree to which these changes represent a 'blip' or the start of a longer-term trend and what effect, if any, this has on A-Level science numbers.

## A-LEVELS

Both maths and further maths have shown very significant increases in participation over the period shown. It is worth noting however that there was a significant drop in A-Level maths numbers in 2002 following government reforms made to A-Levels in 2000.

## 0 THERE IS STILL A VERY SIGNIFICANT GENDER IMBALANCE IN PHYSICS AND FURTHER MATHS

It took until 2007 for maths A-Level numbers to return to 2000 levels. A-Level science numbers have been rising steadily over the last 8 - 10 years. These rises did however come after more than a decade of falling numbers. Chart I, to the right, shows the trend since 1985.

In recent years more males and females have chosen to study science A-Levels but there is still a very significant gender imbalance in physics and further maths (where $79 \%$ and $72 \%$ of the entries were male in 2014 respectively) and, to a lesser degree, in maths ( $61 \%$ male) and biology (59\% female). Chemistry is more balanced, with $48 \%$ of the 2014 cohort being female.

## UNDERGRADUATES

Table 4 to the right shows the growth in full-time undergraduate student numbers since 2003/04. STEM subjects account for around $45 \%$ of undergraduate numbers and this proportion has remained reasonably steady for many years.

However, while overall undergraduate numbers in STEM subject areas have increased by $18 \%$ since 2003/04, this includes a significant growth in the number of non-UK students.Table 3 below shows the number of STEM and non-STEM undergraduates broken down by domicile. UK student numbers in STEM grew by 14\% since 2003/04, while other EU and non-EU student numbers in STEM grew by $72 \%$ and $51 \%$ respectively.

## TEACHER RECRUITMENT

Table 5 to the right shows the number of secondary school teachers in STEM disciplines recruited in recent years. 2013/I4 saw a number of changes to teacher training, including the introduction of School Direct (a school-based teacher training programme) and these changes appear to have affected physics recruitment in particular.

THE INSTITUTE OF PHYSICS AND GOVERNMENT AGENCIES AGREE AROUND I,000 NEW PHYSICS TEACHERS ARE REQUIRED EVERYYEAR

After many years of under-recruiting physics specialists into teaching during the 1990s, numbers picked up significantly during the last decade. Modelling by the Institute of Physics and government agencies agree that around $\mathrm{I}, 000$ new physics teachers are required every year. This number has never been reached, and recruitment fell significantly short of this target in both of the last two years.

Table 5: Secondary school teachers recruited in STEM subjects in England, excluding Teach First route.

## Notes

From 2013/14, general science recruits included within biology.
Data taken from NCTL census (first published version each year).
Teach First data excluded to allow consistent reporting across years. In 2014/I5, Teach First recruited 230 maths teachers; and 231 science teachers including 18 physicists, 26 chemists and 130 biologists (the remainder were general science/other).

## APPRENTICESHIPS

The government-funded apprenticeship system in England has three categories of apprenticeship: intermediate apprenticeships (Level 2); advanced apprenticeships (Level 3); and higher apprenticeships (Level 4 and above). In the last decade there has been a significant expansion in the number of government-funded apprenticeships but, as Chart 2 to the right shows, growth has largely been at Level 2 and in sectors not traditionally associated with apprenticeships, such as health, retail and business administration. In 2012/13, 38,950 people started a Level 3 apprenticeship in science, engineering or technology (SET). A decade earlier, in 2002/03, this figure was 20,950. But this increase is dwarfed by the expansion of non-SET Level 3 apprenticeships, which have risen sixfold from 27,200 in 2002/03 to 167,600 in 2012/13.

Level 2 apprenticeships now dominate. This is a unique feature of the English system - we are the only country where Level 2 apprenticeships far outnumber those at Level 3 , and in countries with world-renowned apprenticeship systems, such as Austria, Germany and Switzerland, almost all apprenticeships are Level 3.

Higher apprenticeships (Level 4 and above), while growing in number in recent years, still represent a tiny proportion of overall apprenticeship numbers. There were 9,800 people who started a higher apprenticeship in 2012/13 and just 700 of these were in SET-related areas. The most popular higher apprenticeships in 2012/13 were in care leadership and management (2,970 starts), management ( 2,540 starts) and accountancy (2,190 starts).

## STEM ENHANCEMENT AND ENRICHMENT ACTIVITIES

There are several national initiatives which seek to enhance and enrich the science and engineering taught in schools and colleges. Three of the most significant are:

## STEM AMBASSADORS

## PROGRAMME

The STEM Ambassadors programme brings volunteers working in STEM sectors into the classroom to enthuse young people about STEM subjects and careers. There are currently 28,000 registered Ambassadors across the UK taking part in around 10,000 activities each year. Over $40 \%$ of Ambassadors are female and $65 \%$ are under 35 years old. A recent evaluation found that pupils are $90 \%$ more likely to be interested in continuing to study STEM subjects after engaging with STEM Ambassadors.

## STEM CLUB

STEM Clubs act as a focus for teachers to engage in STEM activity which takes pupils beyond the curriculum. Around $60 \%$ of UK secondary schools (2,400 schools) currently have a STEM Club, with a target to increase this figure to $80 \%$ by 2015/16.Teachers regularly report that STEM Clubs have led to an increase in pupils' attainment in STEM subjects, and pupils who participate in STEM Clubs are more likely to want a job in STEM.

## THE BIG BANG

The Big Bang is the largest celebration of STEM for young people in the UK. Through a four day national event - The Big Bang Fair - every March, and a series of regional and local events, the Big Bang aims to show pupils aged 7-19 the wide range of exciting and rewarding opportunities that exist in STEM occupations. 5,500 people attended the first Big Bang Fair in 2009. By 2014 , this number had risen to 75,000 .

60

## WE BELIEVE THAT POLICYMAKERS, MEMBERS OF THE STEM EDUCATION <br> COMMUNITY, EMPLOYER GROUPS AND OTHERS MUST MAKE USE OF KEY DATA WHEN DISCUSSING POLICY INTERVENTIONS INTHIS AREA.
